

**HXNS**

HYBRID XNAV - OPTICAL NAV - INERTIAL PROPAGATION

SPONSORED EVALUATION - v0.2

A bounded navigation question. A reproducible engineering answer.

HXNS turns declared processed-sensor assumptions into an auditable software-in-the-loop study for teams deciding whether a hybrid navigation concept merits deeper integration.

For spacecraft R&D teams, university laboratories, avionics/GNC groups, and instrument teams with a defined decision question.

01 - EXISTING BOUNDARY

Standard sponsored study

Use the four established mission windows, configurable processed-sensor assumptions, paired seeds, sensor ablation, and the existing fault campaign.

Fixed quote after fit check

02 - SCOPED CHANGE

Custom feasibility pilot

Scope a new trajectory, body set, sensor-product model, catalogue, interface, cadence, or fault schedule as a defined engineering milestone.

Milestone quote after scoping

03 - NEXT EVIDENCE

Sponsored R&D milestone

Fund hardware-in-the-loop, LEON5 integration work, ephemeris extension, or mission-specific validation with written acceptance criteria.

Deliverables agreed before work

SPONSOR PROVIDES

- A non-confidential engineering decision question for the initial fit check.
- Processed products, units, uncertainty, cadence, and comparison assumptions.
- The required mission window and desired decision date.

HXNS DELIVERS

- Reviewed .hxns configuration and declared assumptions.
- Reproducible paired-seed and sensor-ablation campaign.
- HTML, JSON, CSV artifacts plus a short engineering findings memo.

CAMPAIGN

DELIVERY

COMMERCIAL GATE

Work begins only after written scope, deliverables, exclusions, data handling, commercial terms, and a payment schedule are agreed.
